Cockroaches

Cockroaches destroy food, book bindings and fabrics.

To eliminate cockroaches trade at roach-free stores and watch all boxes or baskets of food and laundry brought into the house.

Fumigation by a professional fumigator is the most effective way of ridding the house of roaches. This method, however, is expensive and in infested areas is apt to give only shortlived relief.

Amateur exterminators should first fill up the cracks which lead to roaches' hiding places with putty, plastic wood, or plaster of Paris. The sodium fluoride powder should be sprinkled along the back of shelving and drainboards.

If possible blow the powder with a duster, bellows, or an electric power duster into the insects' hiding places. Sodium fluoride is poisonous, however, and should be kept out of food and away from children and pets.

Pyrethrum powder is a non-poisonous roach-killer and may be used in the same way. On exposure to air, however, it loses its effectiveness after a time.

Phosphorous pastes are useful. Spread the paste on a piece of cardboard and roll into a cylinder. Wrap around with a rubber band and then place it wherever the roaches have been destructive.

Sprays of kerosene oil and pyrethrum extract may be used also but it must be remembered that these kill only by contact.

German Cockroach Control

0.5% diazinon. Squirt insecticide into cracks and openings, where roaches run. NOT to be sprayed in open room. The product is POISON and must be properly labelled and registered.
